- 04** **10-20 x** ROI (year 1, industry highest)
- 05** **Satisfaction guarantee:** no payment if agreed KPI improvements are not met

## STREAMLINE INVENTORY SOLUTIONS

**1. Demand forecasting** - is a systematic analytical process aimed to predict consumer demand for goods or services based on historical sales data. Knowledge of future demand enables the supplier to keep the right amount of stock on hand and provide good customer service. Demand forecasting drives all company's plans including demand, supply, purchasing, manufacturing, material requirements, and financial plans. The accurate demand forecast is crucial for sustainable business development.

**2. Inventory planning** - is a business process aimed to determine the optimal quantity and timing of inventory for the purpose of integration production capacity and sales. Inventory planning hugely influences a company's turnover, cash flow, and profit margins.

**3. Inventory optimisation** - is an approach for reducing the amount of frozen working capital that is tied up in inventory with service-level goals across multiple stock-keeping units (SKUs).

**4. Material requirements planning (MRP)** - can be defined as a system for calculating the components and materials needed to manufacture a product.

**5. Business Process Outsourcing (BPO)** - In monthly planning sessions, Cornerstone realise inventory optimisation by reviewing system results and make suggestions re order plan adjustments, assist with the establishment and facilitation of a sales and operations plan; and review demand planning business processes to ensure that maximum benefits are gained from the software.

# CORNERSTONE INVENTORY

Making a difference that matters

AFRICA PARTNER FOR STREAMLINE

## WHAT IS STREAMLINE

Streamline is a desktop application for demand forecasting and inventory replenishment planning. The robust time-series decomposition approach employed allows us to create a highly accurate statistical forecast that provides a solid basis for further demand planning processes. Streamline effectively incorporates modern planning technologies and strategies with inventory optimization tools and provides crucial and timely information for decision-making.

If no inventory information entered, Streamline operates solely as demand forecasting tool. With sufficient information, it produces a perfect just-in-time inventory replenishment plan that simultaneously minimizes stock shortages and excesses, optimising your investment in inventory.

# EASY TO DO BUSINESS WITH

- 01** Fast and intuitive user interface
- 02** Smooth and fast implementation process
- 03** Ideal fit of the business process in your company
